Define
$$R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\hat{}}, \ k = R/pR = \mathbb{F}_p^a$$

δ

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\hat{}}, k = R/pR = \mathbb{F}_p^a$ where upperscript $\hat{}$ means *p*-adic completion δ

(日) (日) (日) (日) (日) (日) (日) (日)

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\hat{}}, k = R/pR = \mathbb{F}_p^a$ where upperscript $\hat{}$ means *p*-adic completion

Recall $\phi: R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\hat{}}, \ k = R/pR = \mathbb{F}_p^a$ where upperscript $\hat{}$ means *p*-adic completion Recall $\phi : R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$ Define $\delta : R \to R, \ \delta x = \frac{\phi(x) - x^p}{p}$ Fermat quotient operator

δ

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{, k} = R/pR = \mathbb{F}_p^a$ where upperscript $\hat{}$ means p-adic completion Recall $\phi : R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$ Define $\delta : R \to R, \ \delta x = \frac{\phi(x) - x^p}{p}$ Fermat quotient operator Morally R is the analogue of $C^{\infty}(\mathbb{R}) = \{x = x(t) \mod x : \mathbb{R} \to \mathbb{R}\}$

δ

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\hat{}}, \ k = R/pR = \mathbb{F}_p^a$ where upperscript $\hat{}$ means *p*-adic completion Recall $\phi : R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$ Define $\delta : R \to R, \ \delta x = \frac{\phi(x) - x^p}{p}$ Fermat quotient operator Morally *R* is the analogue of $C^{\infty}(\mathbb{R}) = \{x = x(t) \mod x : \mathbb{R} \to \mathbb{R}\}$ Morally $\delta = \frac{d}{dp}$ is the analogue of $\frac{d}{dt}$

δ

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\uparrow}, k = R/pR = \mathbb{F}_p^a$ where upperscript \uparrow means *p*-adic completion Recall $\phi : R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$ Define $\delta : R \to R, \ \delta x = \frac{\phi(x) - x^p}{p}$ Fermat quotient operator Morally *R* is the analogue of $C^{\infty}(\mathbb{R}) = \{x = x(t) \mod x : \mathbb{R} \to \mathbb{R}\}$ Morally $\delta = \frac{u}{dp}$ is the analogue of $\frac{d}{dt}$ Example: $p = 7; \ \delta 5 = \frac{ud5}{d7} = \frac{5-5^7}{7}$

δ

Define $R = W(\mathbb{F}_p^a) = \hat{\mathbb{Z}}_p^{ur} = \mathbb{Z}_p[\zeta_N; (N, p) = 1]^{\uparrow}, k = R/pR = \mathbb{F}_p^a$ where upperscript $^{\uparrow}$ means p-adic completion Recall $\phi : R \to R$ unique ring homorphism with $\phi(x) \equiv x^p \mod p$ Define $\delta : R \to R, \ \delta x = \frac{\phi(x) - x^p}{p}$ Fermat quotient operator Morally R is the analogue of $C^{\infty}(\mathbb{R}) = \{x = x(t) \mod x : \mathbb{R} \to \mathbb{R}\}$ Morally $\delta = \frac{d}{dp}$ is the analogue of $\frac{d}{dt}$ Example: $p = 7; \ \delta 5 = \frac{d5^n}{d7} = \frac{5 - 5^7}{7}$

More generally δ -ring: a ring A with $\delta : A \to A$ satisfying axioms of the above δ ; for A torsion free this means $\phi(x) = x^p + p\delta x$ is a ring homomorphism.

δ

For X smooth scheme over R

For X smooth scheme over R

Say $f: X(R) \to R$ is a δ -function of order r if for any point in X(R) there exist

Theorem (B, Inventiones 95)

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Remark

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Remark

 ψ_i an arithmetic analogue of the Manin maps $A(K) \to K$ for A/K abelian variety over a function field K

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Remark

 ψ_i an arithmetic analogue of the Manin maps $A(K) \to K$ for A/K abelian variety over a function field K

Remarks

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Remark

 ψ_i an arithmetic analogue of the Manin maps $A(K) \to K$ for A/K abelian variety over a function field K

Remarks

The above Theorem should be viewed as a lift to characteristic zero in δ -geometry of the fact that the first Greenberg transform $Gr^1(A)$ of A is, up to isogeny, a product of A mod p with a vector group; note the shift from 1 to 2!

Theorem (B, Inventiones 95)

A/R abelian scheme of dimension g. There exists linearly independent δ -functions $\psi_1, ..., \psi_g \in \mathcal{O}^2(A)$ which are group homomorphisms $A(R) \to R$.

Remark

 ψ_i an arithmetic analogue of the Manin maps $A(K) \to K$ for A/K abelian variety over a function field K

Remarks

The above Theorem should be viewed as a lift to characteristic zero in δ -geometry of the fact that the first Greenberg transform $Gr^1(A)$ of A is, up to isogeny, a product of A mod p with a vector group; note the shift from 1 to 2!

The homomorphism property should be viewed as an "extra-symmetry" of the function ψ

Remarks

Remarks

1. f^1 above can be viewed as a lift to characteristic zero in δ -geometry of the Kodaira-Spencer class $\frac{2AdB-3BdA}{\Delta}$ of the universal family of elliptic curves $y^2 = x^3 + Ax + B$; the reduction mod p of f^1 is $H\frac{2AdB-3BdA}{\Delta}$ + (order zero terms) where H is the Hasse invariant.

Remarks

1. f^1 above can be viewed as a lift to characteristic zero in δ -geometry of the Kodaira-Spencer class $\frac{2AdB-3BdA}{\Delta}$ of the universal family of elliptic curves $y^2 = x^3 + Ax + B$; the reduction mod p of f^1 is $H\frac{2AdB-3BdA}{\Delta}$ + (order zero terms) where H is the Hasse invariant.

2. $f^{\partial} \mod p$ is H so f^{∂} can be viewed as a lift to characteristic zero in δ -geometry of H; the lift E_{p-1} should be viewed as a wrong lift because it is not isogeny covariant.

Remarks

1. f^1 above can be viewed as a lift to characteristic zero in δ -geometry of the Kodaira-Spencer class $\frac{2AdB-3BdA}{\Delta}$ of the universal family of elliptic curves $y^2 = x^3 + Ax + B$; the reduction mod p of f^1 is $H\frac{2AdB-3BdA}{\Delta}$ + (order zero terms) where H is the Hasse invariant.

2. $f^{\partial} \mod p$ is H so f^{∂} can be viewed as a lift to characteristic zero in δ -geometry of H; the lift E_{p-1} should be viewed as a wrong lift because it is not isogeny covariant.

3. 6 and 7 above can be viewed as lifts to characteristic zero in δ -geometry of the Serre-Swinnerton Dyer theorem on the kernel of the Fourier expansion map $\overline{M} \rightarrow k((q))$ in characteristic p.

Theorem (B+Saha: JNT 2012)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Theorem (B+Saha: JNT 2012) If $S^{\infty}_{\heartsuit} = Im(M^{\infty} \to R((q))^{\infty})$ and $S^{\infty} := \cup \mathcal{O}^{n}(X)$ then $\widehat{S^{\infty}} \subset \widehat{S^{\infty}_{\heartsuit}}$ is a $\mathbb{Z}_{p}^{\times} - \delta$ -extension

Theorem (B+Saha: JNT 2012) If $S^{\infty}_{\nabla} = Im(M^{\infty} \to R((q))^{\infty})$ and $S^{\infty} := \cup \mathcal{O}^{n}(X)$ then $\widehat{S^{\infty}} \subset \widehat{S^{\infty}_{\nabla}}$ is a $\mathbb{Z}_{p}^{\times} - \delta$ -extension

Remark

Theorem (B+Saha: JNT 2012) If $S_{\heartsuit}^{\infty} = Im(M^{\infty} \to R((q))^{\infty})$ and $S^{\infty} := \cup \mathcal{O}^{n}(X)$ then $\widehat{S^{\infty}} \subset \widehat{S_{\heartsuit}^{\infty}}$ is a $\mathbb{Z}_{\rho}^{\times} - \delta$ -extension

Remark

The theorem above can be viewed a lift to characteristic zero in δ -geometry of the fact that the Igusa curve $I_1(N)_{/\mathbb{F}_p}$ in characteristic p is a \mathbb{F}_p^{\times} -cover of the modular curve $X_1(N)_{/\mathbb{F}_p}$. $I_1(N)_{/\mathbb{F}_p}$ has another lift to characteristic zero in usual algebraic geometry; that lift is a \mathbb{F}_p^{\times} -cover of the modular curve $X_1(N)_{/\mathbb{Z}_p}$ and should be viewed as the wrong one because the symmetry group is too small

Theorem (B: JNT 2008, B+Poonen, Compostio 2009)

If $f = \sum a_n q^n$ is a new form of weight 2 over \mathbb{Z} then the form $f^{\sharp} \in M^2(0)$ obtained by composing the Eichler-Shimura map $\Phi : X_1(N)(R) \to A_f(R)$ with the homomorphism $\psi : A_f(R) \to R$ has a δ -Fourier expansion that is $\delta - p$ -symmetric and that is congruent mod p to

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Theorem (B: JNT 2008, B+Poonen, Compostio 2009)

If $f = \sum a_n q^n$ is a new form of weight 2 over \mathbb{Z} then the form $f^{\sharp} \in M^2(0)$ obtained by composing the Eichler-Shimura map $\Phi : X_1(N)(R) \to A_f(R)$ with the homomorphism $\psi : A_f(R) \to R$ has a δ -Fourier expansion that is $\delta - p$ -symmetric and that is congruent mod p to

 $\sum_{p|h} \frac{a_n}{n} q^n - a_p \left(\sum a_m q^{mp}\right) \frac{q'}{q^p} + \left(\sum a_m q^{mp^2}\right) \left(\frac{q'}{q^p}\right)^p$

Theorem (B: JNT 2008, B+Poonen, Compostio 2009)

If $f = \sum a_n q^n$ is a new form of weight 2 over \mathbb{Z} then the form $f^{\sharp} \in M^2(0)$ obtained by composing the Eichler-Shimura map $\Phi : X_1(N)(R) \to A_f(R)$ with the homomorphism $\psi : A_f(R) \to R$ has a δ -Fourier expansion that is $\delta - p$ -symmetric and that is congruent mod p to

 $\sum_{p \mid h} \frac{a_n}{n} q^n - a_p \left(\sum a_m q^{mp}\right) \frac{q'}{q^p} + \left(\sum a_m q^{mp^2}\right) \left(\frac{q'}{q^p}\right)^p$

Remark

Theorem (B: JNT 2008, B+Poonen, Compostio 2009)

If $f = \sum a_n q^n$ is a new form of weight 2 over \mathbb{Z} then the form $f^{\sharp} \in M^2(0)$ obtained by composing the Eichler-Shimura map $\Phi : X_1(N)(R) \to A_f(R)$ with the homomorphism $\psi : A_f(R) \to R$ has a δ -Fourier expansion that is $\delta - p$ -symmetric and that is congruent mod p to

$$\sum_{p|h} \frac{a_n}{n} q^n - a_p \left(\sum a_m q^{mp}\right) \frac{q'}{q^p} + \left(\sum a_m q^{mp^2}\right) \left(\frac{q'}{q^p}\right)^p$$

Remark

 $\sum n^{p-2}a_nq^n$ has a remarkable lift to characteristic zero as a *p*-adic modular form a la Serre, $\sum \frac{a_n}{n}q^n$; this should be viewed as a wrong lift while f^{\sharp} above should be viewed as the "correct" lift because it has more symmetry "with respect to Heegner points"

Example 6: f^0

<□ > < @ > < E > < E > E のQ @

Example 6: f^0

 f^0 is not a $\delta-{\rm modular}$ form but rather an "Igusa $\delta-{\rm modular}$ form. It has weight 1 and $\phi(f^0)/f^0=f^\partial$

Example 6: f^0

 f^0 is not a δ -modular form but rather an "Igusa δ -modular form. It has weight 1 and $\phi(f^0)/f^0 = f^{\partial}$

 f^0 should be viewed as the "correct" lift to characteristic zero of Serre's weight one modular form mod p on the Igusa curve a; we skip this discussion; cf. B+Saha, JNT 2012

but having "correct" lifts Σ_{δ}/R in δ -geometry

What makes a lift "correct" versus "wrong" are certain extra " δ -symmetries" such as:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- big δ -Galois group
- homomorphism property
- δp -symmetry of series expansion

We saw algebro-geometric objects $\overline{\Sigma}/k$

having "wrong" lifts Σ/R in algebraic geometry

but having "correct" lifts Σ_{δ}/R in δ -geometry

What makes a lift "correct" versus "wrong" are certain extra " δ -symmetries" such as:

- big δ -Galois group
- homomorphism property
- δp -symmetry of series expansion
- isogeny covariance, etc.

there is evidence of connections between the above manifestations of $\delta\text{-symmetry}$ which may indicate the presence of a common concept

We saw algebro-geometric objects $\overline{\Sigma}/k$

but having "correct" lifts Σ_{δ}/R in δ -geometry

What makes a lift "correct" versus "wrong" are certain extra " δ -symmetries" such as:

- big δ -Galois group
- homomorphism property
- δp -symmetry of series expansion
- isogeny covariance, etc.

there is evidence of connections between the above manifestations of $\delta\text{-symmetry}$ which may indicate the presence of a common concept

There is evidence that \sum_{δ}/k could be central fibers for deformations in a (yet to be developed) δ -arithmetic deformation theory
